

The U.S. Environmental Protection Agency's **ENERGY STAR® Program** promotes the use of high-efficiency technologies and equipment. ENERGY STAR labeled homes use at least 30% less energy than homes built to meet the national Model Energy Code while maintaining or improving indoor air quality. These fact sheets are designed to help consumers learn more about the energy-efficient improvements to their ENERGY STAR labeled homes.

ENERGY STAR® LABELED BOILERS

MECHANICAL EQUIPMENT IMPROVEMENTS

On average, space heating accounts for 33 percent of home energy use, but this can increase to over 60 percent in the colder parts of the United States. Boilers are a type of heating equipment that burn fossil fuel (usually oil or natural gas) and transfer the heat to water. The hot water is distributed through pipes to radiators, fan coil units, baseboard convection units or radiant loops which heat the living spaces within a home. A thermostat controls the boiler to maintain a temperature set by the occupants. Hot water systems are also referred to as "hydronic heating" systems.

Combustion of fossil fuels is a major source of air pollution. High-efficiency heating equipment generate less air pollution than standard efficiency equipment. That is why the U.S. Environmental Protection Agency (EPA) includes high-efficiency boilers in its ENERGY STAR Labeling Program. This voluntary program encourages manufacturers to display the ENERGY STAR label on equipment that meet or exceed an energy-efficiency level set by EPA.

Prior to sale, the operating efficiencies of some boilers are tested and each model is given an Annual Fuel Utilization Efficiency (AFUE) rating, which is a ratio of the heat produced to the energy consumed on an annual basis. Federal appliance standards require that boilers have a minimum AFUE rating of 0.80 (at least 80 percent efficient). Boilers with an ENERGY STAR label have a minimum AFUE of 0.85 (85 percent efficient) which is achieved by improvements such as solid state controls, electronic ignition (no pilot light), and direct or power venting, as shown in Figure 1. Since ENERGY STAR labeled boilers use 5 percent to 15 percent less energy than standard efficiency models, they can save up to \$75 per year on home heating bills.

Besides ENERGY STAR labeled space heating equipment, ENERGY STAR labeled homes often have other energy-efficient features such as increased insulation, air sealing, and high-performance windows. Combinations of these features can often allow for the installation of smaller, less costly heating equipment.

fact sheet available from the Energy Efficiency and Renewable Energy Clearinghouse (EREC), P.O. Box 3048, Merrifield, VA 22116, 1-800-DOE-EREC (1-800-363-3732)

BENEFITS

Installing ENERGY STAR labeled boilers can provide many benefits including:

Increased quality. ENERGY STAR labeled boilers exceed the minimum efficiency levels established by the federal appliance standards. These improved efficiency levels are often achieved with better components and improved technologies. This can result in longer equipment life and extended manufacturer's warranties.

Improved safety. ENERGY STAR labeled boilers are usually direct or power vented. This reduces the risk of "back drafting" dangerous carbon monoxide gas into a house.

Lower utility bills. The average home owner spends approximately \$400 per year on space heating. ENERGY STAR labeled boilers can reduce this amount by \$25 to \$75, thus making homes less expensive to operate.

Improved resale position. ENERGY STAR labeled boilers can provide the many impressive benefits listed above, resulting in a more comfortable and safer home with lower utility bills. These benefits can translate into a higher resale value.
